

Group 4 – Topic 5

Service composition

Christoph Paur, Ondrej Balún, Dominik Kertys

QoS based service selection in WS Composition

- ♦ Optimization-based – local/global
- ♦ Negotiation-based – automated process by negotiator agent
- ♦ Hybrid approaches
 - ♦ Matchmaking
 - ♦ Provider selection
 - ♦ Agreement configuration

Main goal

- build a service composition that integrates different existing or yet-to-built Web services

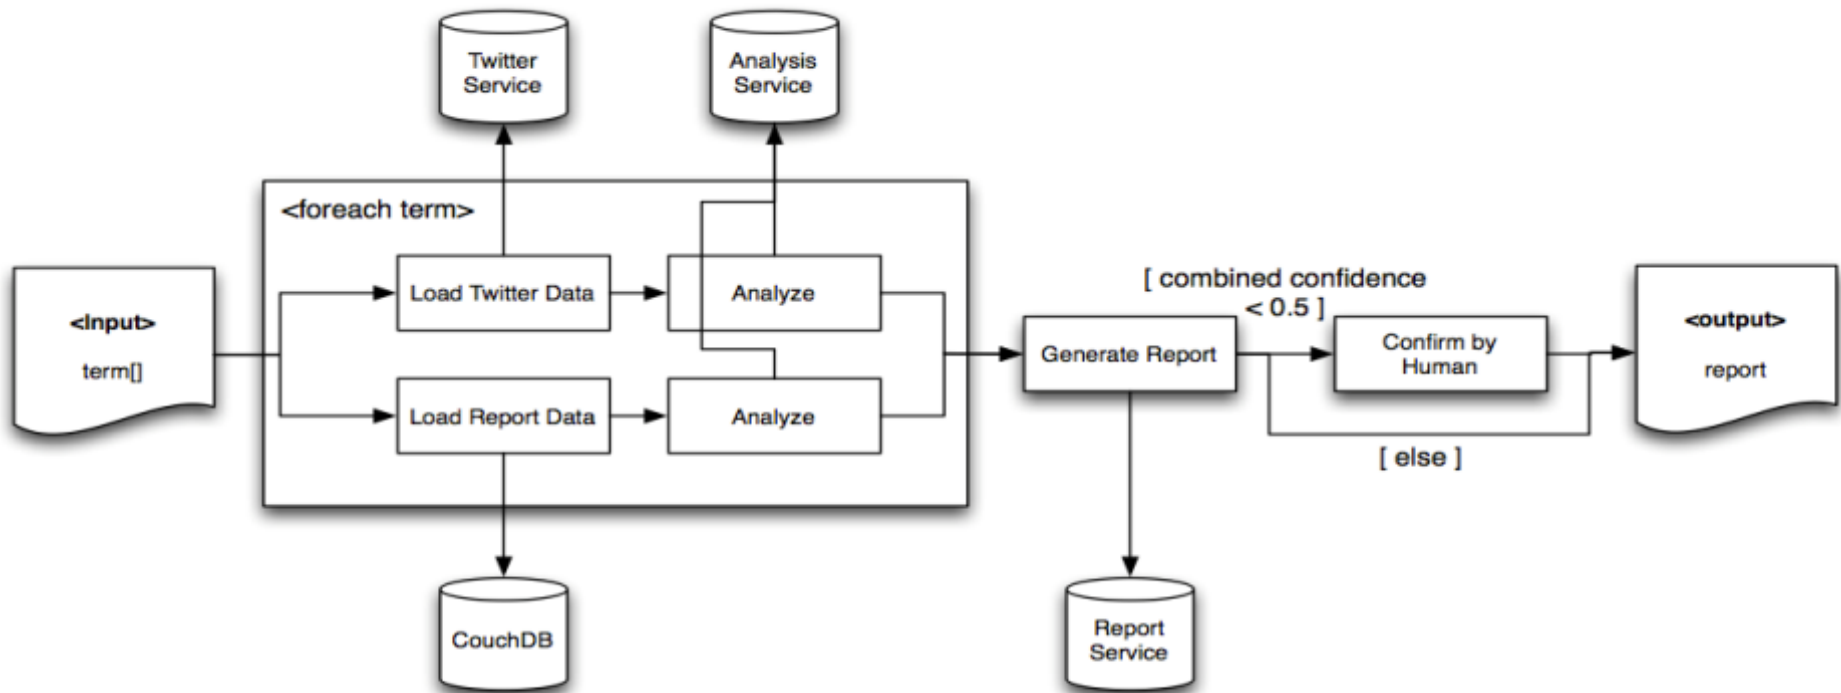

Figure 1: Sentiment Analysis Process Sketch

Composition IDE Tools

- ◆ NetBeans 6.5.1 with SOA(service-oriented architecture)
 - ◆ GlassFish ESB v2.1 – free standard application server
 - ◆ easy drag&drop editor
 - ◆ composite app – includes multiple BPEL Modules and other types of Java Business Integration (JBI) modules
 - ◆ easy test integration
 - ◆ easy to implement own Java services

Our services

- ◆ Twitter service
 - ◆ Custom Web Service (handles OAuth)
 - ◆ troubles with SSL certificate
- ◆ CouchDB service
 - ◆ Custom Web Service (handles Search function generation)
- ◆ HumanActivity service
 - ◆ Receives low confidence reports from BPEL Web Service
 - ◆ Returns confirmed or altered report depend. on Human choice

GUI

- ◆ JAXB Binding – Java Architecture for XML binding
- ◆ JSP
- ◆ deploying of WSs to Glassfish
- ◆ Analyse servlet – executes the composition
- ◆ ViewPdf servlet – enables PDF functionality
- ◆ Confirm by Human – accept, reject, upload PDF

BPEL - Advantages

- 💧 Really simple cases work
- 💧 Automatic Generation of Process Flow
 - 💧 Impress your CEO
- 💧 Lots of presentations with corporate fuzz
 - 💧 May help with decision makers
- 💧 Language Focus *Process Orchestration*
 - 💧 Compensation-Handlers
 - 💧 Run on *finished* scopes if a fault happens *later*
 - 💧 Necessary when no locks can be held for rollback

BPEL - Disadvantages

- ◆ Even simple tasks take forever
- ◆ More complex tasks quickly turn unwieldy
 - ◆ Complex in the BPEL sense
 - ◆ E.g. Merge two Lists or Arrays
 - ◆ Check if a variable is unassigned (null)
- ◆ Graphical designer cannot hide the complexities of BPEL
 - ◆ Complex IF conditions
 - ◆ Data Conversions (XML Namespaces!)

BPEL - Disadvantages

- ◆ Need to switch between Graphical Designer and Source Code
 - ◆ No Auto-Complete for Variables and Properties
 - ◆ Namespaces unintuitive
- ◆ Multiple Technologies involved
 - ◆ Obviously: BPEL
 - ◆ WSDL, XSD, XSLT, ...
 - ◆ WS-Adressing, WS-Security, ...
- ◆ Debugging is extremely cumbersome
 - ◆ Deploying to BPEL Engine takes a while
 - ◆ Data stored in XML

BPEL - Problems

- ◆ Not really platform-agnostic
 - ◆ Every vendor has their own set of extensions
 - ◆ E.g. <bpelx:append>, :remove>, :copyList>
 - ◆ Address most common Shortcomings
 - ◆ Leads to vendor-specific „code “
 - ◆ BPEL-Specification not fully supported

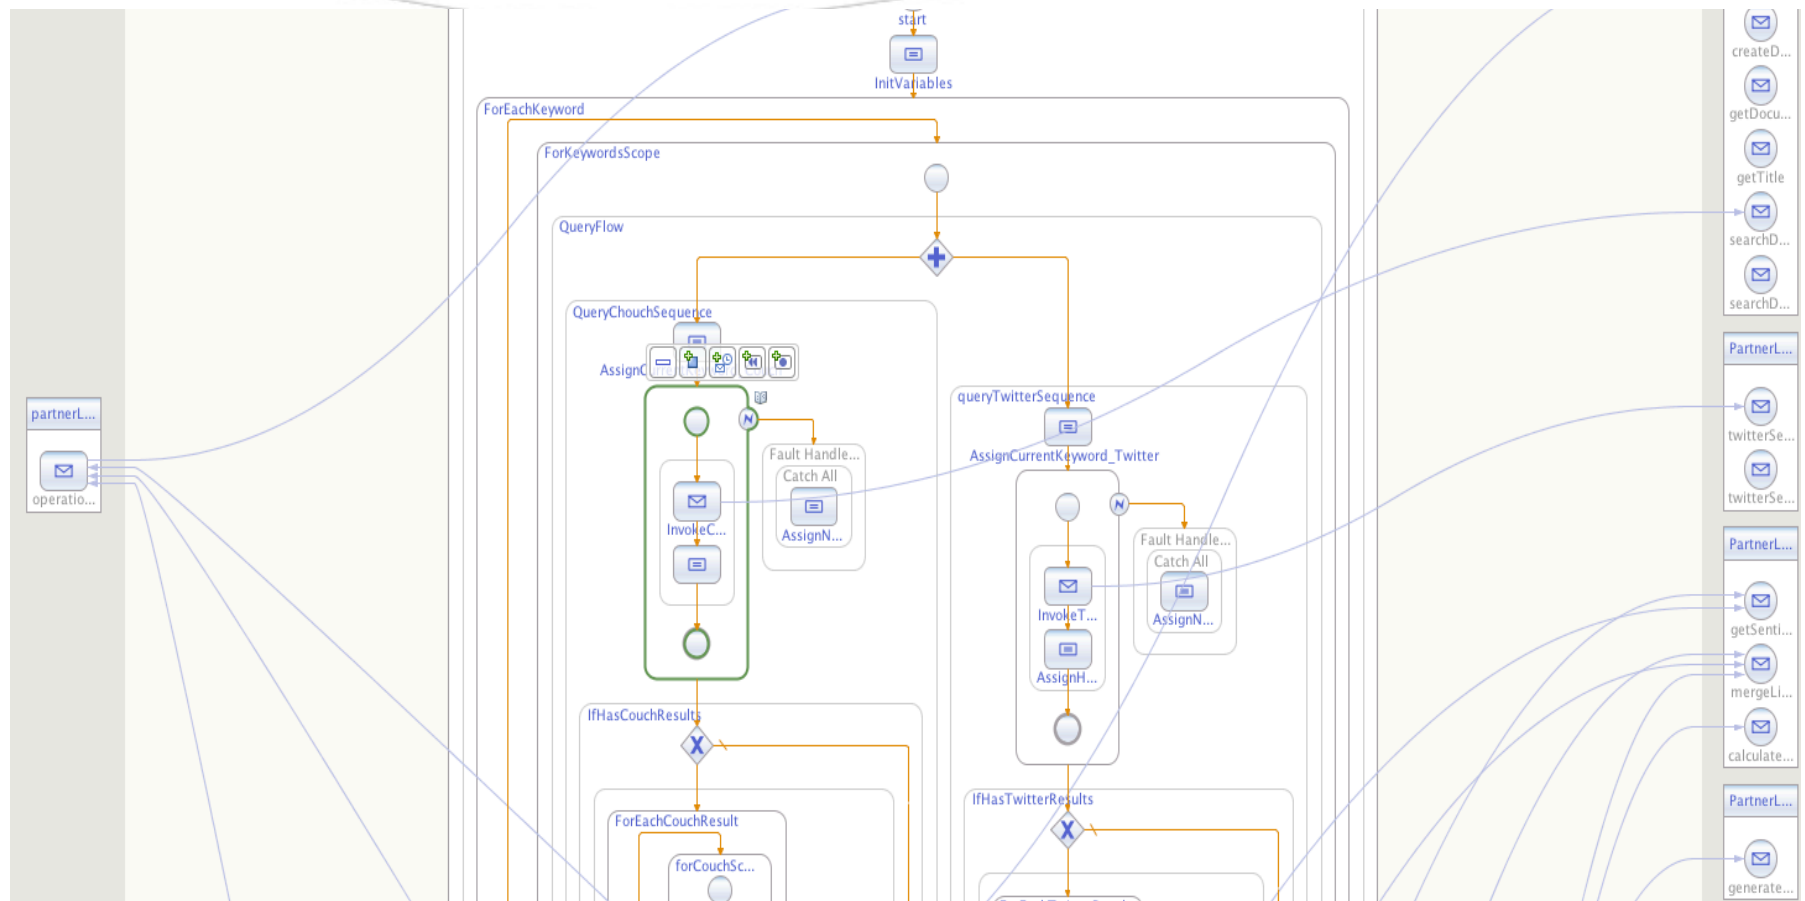

BPEL - Problems

- ◆ Kind of dead, though some might argue
 - ◆ Oracle 11g released before 2009
 - ◆ Apache ODE still alive (Oct. 2013)
 - ◆ Just BPEL Engine, not an IDE (see Eclipse BPEL)
 - ◆ Only Bugfixes and Performance improvements?
 - ◆ Last Open Source Updates:
Netbeans SOA 2008, (jOpera 2011),
Eclipse BPEL Designer 2011

BPEL - Problems

- ◆ Poor Support for Parallelism
 - ◆ No Synchronization Constructs (Locks, etc)
 - ◆ <For>-Loop: parallel=true not supported by Netbeans/SUN BPEL Engine
 - ◆ Even Oracle seems to have (had?) problems
 - ◆ No true parallelism, just preemptive multitasking
 - ◆ Web Service calls still block the Process
 - ◆ Even Wait blocks
 - ◆ <http://technology.amis.nl/2008/10/23/>
